

ADMINISTRATION A BRONCHODILATOR USING AN INHALATION AND MASK

GIVE INHALED SALBUTAMOL FOR WHEEZING

USING AN INHALATION CHAMBER

An inhalation chamber is a means of efficiently delivering bronchodilator medication to the lungs. No child under the age of 5 should be given an inhaler without a . If **used** correctly, an inhalation chamber works just as well as a nebulizer.

Repeat up to 3 times every 15 minutes before classifying pneumonia.

Dosage: 2 puffs per dose, 3 times every 15 .

Inhalation can be designed as follows:

- Use a 500 ml beverage bottle or similar.
 - Cut a hole in the bottom of the bottle in the same shape as the mouthpiece of the inhaler. This can be done with a sharp knife.
 - Cut the bottle between the top quarter and the bottom 3/4, disregarding the top quarter of the bottle.
 - Cut a small V at the border of the large open part of the bottle to fit the child's nose and be used as a mask.
 - Cover the edge of the cut bottle with a candle or plaster to soften it.
- For a small baby, a mask can be made by cutting a similar hole in a plastic cup (not polystyrene). Whenever possible, appropriate commercially available inhalation chambers should be used.

How do I use an inhalation chamber?

- Remove the inhaler cap.
 - Shake the inhaler well.
 - Insert the mouthpiece of the inhaler into the hole in the plastic bottle or cup.
 - The child should put the opening of the bottle in his mouth and breathe in and out through his mouth.
 - A caregiver then presses the inhaler and sprays into the bottle while the child continues breathe normally.
 - Wait three to four breaths and repeat.
 - For young children, place the cup over the child's mouth and use it as a spacer in the same way.
- * If an inhalation chamber is being used for the first , it should be primed with 4 to 5 additional puffs from the inhaler.

Administration d'un bronchodilatateur à l'aide d'une chambre d'inhalation et d'un masque. Une chambre d'inhalation peut être fabriquée localement avec une bouteille en plastique.
