

SUGAR DIABETES

1. Definition

Diabetes mellitus is a chronic disease, caused by a partial or total lack of insulin, characterized by chronic hyperglycemia which is associated with acute (ketoacidosis, hypoglycemia, etc.) and late chronic complications affecting the eyes, kidneys, feet, nerves, brain, heart and blood vessels.

Biologically, diabetes is manifested by a fasting venous blood glucose level ≥ 7 mmol/l (1.26 g/l) or a blood glucose level ≥ 11.1 mmol/l (200 mg/dl) after taking 75 g of sugar.

In asymptomatic subjects, a single abnormal blood glucose level is not enough to diagnose diabetes.

2. Circumstances of discovery

Symptoms :

- Intense thirst (polydipsia) corresponding to urine
- Frequent, heavy urine output (polyuria): 3 to 4 liters per day
- Weight loss corresponding to a reduction in body fat and muscle mass
- Asthenia
- Abdominal pain
- Sometimes intense hunger, visual disturbances and tingling feet.

3. Case management

a) Treatment goals :

- Fasting blood glucose < 126 mg/dl
- Disappearance of symptoms in favor of the disease
- Preventing complications

b) Hygienic and dietary measures :

- Stick to your diet, avoiding fast sugars
- Exercise: active walking for at least 30 minutes a day, 3 times a week

c) Drug treatments METFORMIN
